

The Fogging Process

What is fogging?

When a mold inspector refers to fogging, it is the process by which the GM2000 is applied within your dwelling. The product is misted by use of a spray device and so can gain far greater and more consistent coverage of an entire home, similar to the steam created when you have a hot shower.

Why fog the entire house instead of only the room that has the mold?

This is simply because mold spores spread. They are carried on your clothing as well as being present in the air. If the entire dwelling is not fogged, then the mold will return in other rooms under the right conditions.

What does all this mean?

The bottom line here is that we can confidently use GM2000 knowing that you are extremely unlikely to have any reaction to it. It is not going to harm any of your furnishings either. We have performed many treatments with occupants who suffer with such ailments as asthma and multiple sclerosis and others going through chemotherapy. All have reported improvements in their own wellbeing following mold removal and fogging, with a lot of clients opting for an annual fog regardless of the fact that mold may not be present.

If you have any concerns at all, you can contact your technician who will be happy to discuss them with you.

Note: If you are shopping around for mold remediation, please ensure that the products used have been tested and pose little to no danger to your health and well-being. Some companies use products that are not designed for mold remediation and are acidic, causing severe necrosis to tissue, yet will claim that they are non-toxic.
